

Bolted joints analysis by CETIM-COBRA

Cobra
cetim

Cetim-Cobra

CETIM = Centre d'Etudes Techniques des Industries Mécaniques

- ▶ Cetim is a French technical center dedicated to mechanical industries
 - ▶ One of its department is specialized in assembly engineering
 - ▶ COBRA is a software that has support with assembly experts

COBRA = Bolted joint calculation software

- ▶ Compliant with **VDI 2230** and **NF E 25-030-2**
 - ▶ **Analytical calculation** of a **single bolt joint** with **controlled tightening**
- ▶ Fastener and parts are modelled through an equivalent spring
 - ▶ Simple **linear model** built from geometric and mechanical properties of parts
- ▶ **Operational data is considered**
 - ▶ Tool accuracy, friction dispersion

Bolt calculation according to VDI2230 and NFE 25030-2

Calculation steps

- ▶ Spring model definition
 - ▶ Parts stiffness are calculated assuming a conical volume of uniform compression
- ▶ Preload range determination (F_0^{\min} , F_0^{\max})
 - ▶ Minimum preload to avoid opening or sliding
 - ▶ Maximum preload to avoid yielding
- ▶ Achieved preload calculation (F_0^- , F_0^+)
- ▶ Preload range and achieved preload comparison
 - ▶ Defines risks of opening/sliding or yielding
- ▶ Assembly checking under maximum load
 - ▶ Bolt stress, thread alternate stress, pressure at joint faces, thread strength ...

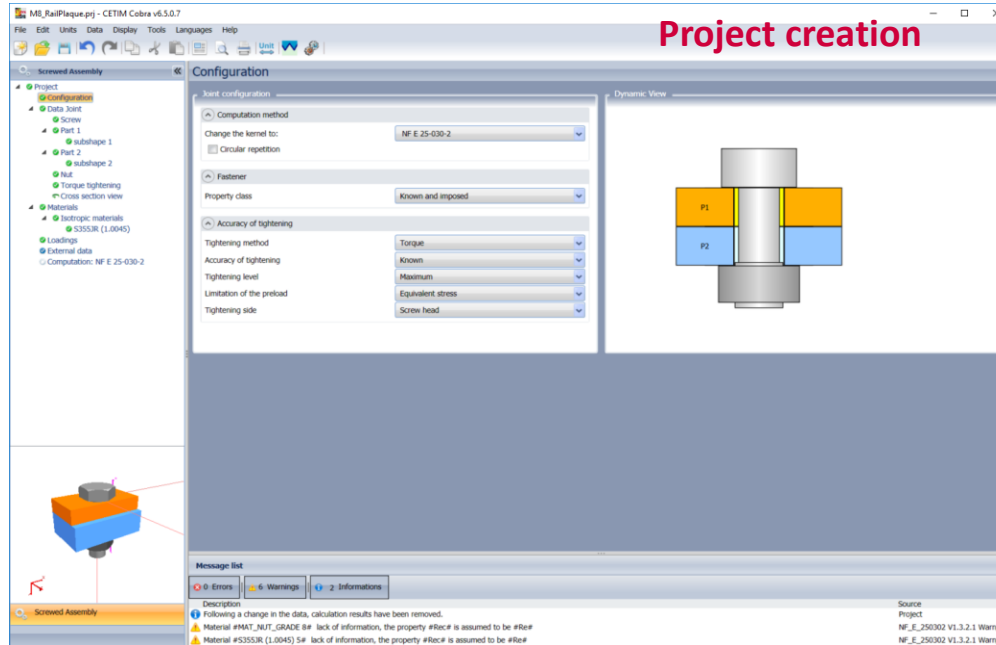

Cobra main features

Bolted joint calculations using COBRA

- ▶ Designing and verifying a single bolted joint according to VDI2230 and NFE 25-030-2 are performed in a few minutes with Cobra
- ▶ Enhanced calculations :
 - ▶ Cobra can handle non-cylindrical parts
 - ▶ Torque tightening but also hydraulic tensioning and angle tightening
-  Many wizards will help the user to define the joint
 - ▶ Preselection of a bolt diameter, torque tightening, fatigue limit, ...
-  Cobra is provided with multi-standard databases
 - ▶ Material characteristics, thread definition, friction coefficient, ...
-  Custom catalogues can be defined
 - ▶ Standardized solution right from the beginning of studies

Use of Cobra

Main steps

► Project configuration

- Fastener type
(screw, stud, threaded rod)
- Number of clamped parts
- Tightening method
(torque, tension, angle)
- Check assembly only or
also define tightening
conditions
- ...

Main steps

- ▶ Input geometry of fastener and parts
- ▶ Set material properties (elastic characteristics)
- ▶ Define tightening parameters
- ▶ Define loadings

Use of Cobra

Main steps

Project creation

Input data

Result analysis

Results

PRELOAD ACHIEVED DURING THE ASSEMBLY

Minimum achieved preload	F_{a-}	: 10 201 N
Nominal achieved preload	F_a	: 13 538 N
Maximum achieved preload	F_{a+}	: 18 520 N

ELASTIC RESERVE OF THE SCREW

Mean elongation	Δl_0	: 43 μm
-----------------------	--------------	--------------------

MAXIMUM STRESSES IN THE FASTENER

Stress area of the screw	A_t	: [35.53 , 36.59] mm^2
--------------------------------	-------	---------------------------------

During the tightening operation

Maximum total tensile stress in the screw	$\sigma_{p\text{max}}$: 521 MPa
Maximum bending stress in the screw	$\sigma_{b\text{max}}$: 0 MPa
Maximum torsional stress in the screw	τ_{max}	: 214 MPa
Maximum equivalent stress in the screw	σ_{equmax}	: 640 MPa

In service

Maximum stress in the screw due to preload	$\sigma_{p\text{max}}$: 521 MPa
Maximum stress in the screw due to external tensile loads	$\sigma_{L\text{max}}$: 12 MPa
Maximum total tensile stress in the screw	$\sigma_{T\text{max}}$: 533 MPa

Message list

- Material #MAT_NUT_GRADE 8-8: lack of information, the property #Rec# is assumed to be #Rec#
- Material #S355JR (1.0045) S# : lack of information, the property #Rec# is assumed to be #Rec#
- Material #MAT_GRADE 8-8: lack of information, the property #Rec# is assumed to be #Rec#

- Detailed results
- Simple color code analysis
 - ✓ Acceptable
 - Acceptable but close to limits
 - Caution : results over limits
- Compressed area and volume

Use of Cobra

Main steps

Project creation

Input data

Result analysis

Calculation report:

- Simplified or detailed automatic report
- Units : metric or US/UK system
- Language: French or English

Cobra limitations

Limitations of VDI2230 / NFE 25030-2

- ▶ Single bolt analysis
- ▶ Need of a continuous volume around the bolt
- ▶ Model validated in specific domain
 - ▶ standard sizes (M4 to M39)
 - ▶ High stress steel bolts (8.8 to 12.9 or A-70 A-80)
 - ▶ Metallic (steel) parts
 - ▶ *Cobra extends the model to any size and any isotropic material properties (use with caution and engineering judgement)*

Software limitations

- ▶ No link with other software (CAD, FEM, ...)
 - ▶ Export to FEM is a new feature of the upcoming release (September 2023)

Cobra advantages

Advantages of using CETIM-COBRA

- ▶ No need of CAD-files
- ▶ Built-in wizards to ease model setup
- ▶ Fast analytical calculations dedicated to bolted joints according to VDI 2230 and NF E 25-030-2 standards
 - ▶ Ideal for solution iterations

Easier and faster than Finite Element Analysis

- ▶ FEM is complex and need more input data
- ▶ FEA doesn't consider operational data easily
- ▶ FEA is time and cost consuming (especially for bolt analysis)

Typical use-case

Typical user profile

- ▶ Engineers (assembly design and dimensioning, tightening definition)
- ▶ Transportation industry, oil/gas, heavy machinery, ...
 - ▶ Any industry where bolt assembly requires a precise preload

Typical use of Cobra

- ▶ Assembly definition: validating bolt size and material, clamped thickness, ...
- ▶ Tightening definition: torque value considering dispersion
- ▶ Assembly validation: parts and bolt integrity, threads resistance in fatigue
- ▶ Sensitivity analysis: impact of friction dispersion, tool accuracy
