ALTAIR LICENSE SERVER

Altair Monarch™ is the industry's leading self-service data preparation solution. Monarch is a desktop software application designed for Windows-based operating systems, and is licensed on a per desktop basis. For larger deployments with multiple users, Altair offers the ability to centrally manage your licenses.

When you install our Desktop Monarch products you are asked to authenticate with one of our licensing methods. In larger and distributed deployments, activating and deactivating licenses and managing large numbers of activation codes becomes difficult, especially as users come and go over time. The Altair License Server allows users to go to one place to get access, control access, and measure usage of the product over time.

The Altair License Server
- Centrally manages authorization and authentication of Monarch software
- Easily works for organizations with a distributed workforce
- Simply add and remove users as needed
- Allow named users to use Monarch software on any machine in the organization
- Enables Monarch usage in virtualized software environments such as Citrix XenApp and VDI
- Re-allocate an existing license from one user to another
- Track Monarch usage on a per user basis

Altair License Server is a licensing management installer for Monarch. It serves requests from Monarch when users attempt to log in and provides information on the products users are entitled to access with their licenses. Additionally, enabling customers to access the software via login/ named user credentials in the server, Monarch can be run in a virtual environment, thus eliminating the need to locally install software on each laptop/desktop.

Licenses for users are managed through instances. An instance defines the product and the license to which a user is entitled access. When a user attempts to log in to Monarch, it calls Altair License Server by instance name and checks whether or not this user exists within this instance. If the user does exist, he or she is authorized to log in and the license that this user is entitled to is automatically applied.

SUPPORT FOR HTTPS CONNECTION AND AUTHENTICATION THROUGH ACTIVE DIRECTORY

ACTIVITY REPORTS ARE AVAILABLE TO TRACK USAGE

LICENSE SERVER CAN RUN IN A VIRTUAL MACHINE
